Executive Insight and Business Recommendation

Key Insights

- The overall churn rate is quite high i.e around **35%** , which clearly shows that we are losing a large number of customers and this needs immediate attention.
- Customers on the **Basic plan** tend to leave more often and also contribute less revenue, which indicates issues related to pricing, value, or feature limitations.
- **SMB and Individual customers** are putting the **highest revenue at risk**, so retaining these segments can directly improve business performance.
- Almost **half of the churn is happening due to competition and pricing**, which means customers are finding better or cheaper alternatives in the market.
- Many customers fall under **high and medium risk categories**, which is actually a good sign because it gives the business a chance to take **early action** and prevent churn.

Recommended Business Actions

- Introduce **short-term plans like 7-day or 15-day options** for users who don’t want long subscriptions, which can help reduce early drop-offs.
- Provide **special retention offers, discounts, or loyalty rewards** to high-risk premium customers so they feel valued and stay longer.
- Set up **early warning alerts based on churn risk or severity scores**, so the team can take action before the customer actually leaves.
- Revisit **pricing strategies and create attractive bundled offers**, especially where churn is highest and competition is strong.
- Run **focused retention campaigns for SMB and Individual customers**, as saving these segments will help protect a large portion of revenue.
